#### TERMODINÁMICA

# Ejercicio del Tema 5

Nombre Grup	oos A-E-G
-------------	-----------

No está permitido el empleo de calculadoras programables ni la consulta de libros, apuntes o formularios. Los teléfonos móviles y relojes "smartwatch" deberán permanecer apagados y fuera del alcance del alumno.

La figura muestra una bomba de calor geotérmica que toma calor del terreno (foco térmico a 20 °C) a través del evaporador y lo cede en el condensador a una corriente de agua que circula por un suelo radiante. El agua (c = 4,18 kJ/kg-K;  $\rho$  = 1000 kg/m³) llega al codnensador a 35 °C y sale del mismo a 45 °C, sin perder presión. El condensador cede 45 kW al agua.

El compresor de la bomba es adiabático, con un rendimiento isentrópico del 75%. Las presiones a su entrada y salida son 5,5 bar y 17 bar, respectivamente. El fluido de trabajo (R290, ver tablas) llega al compresor (1) como vapor saturado y sale del condensador (3) como líquido saturado. Se desprecian las caídas de presión en intercambiadores y conductos.

El ambiente se encuentra a 0 °C.

### Se pide:

Potencia consumida por el compresor
 Exergía destruida total
 Eficiencia exergética de la bomba de calor
 Diagrama de Sankey cualitativo de la planta incluyendo todos los componentes
 (2 p)
 (2 p)

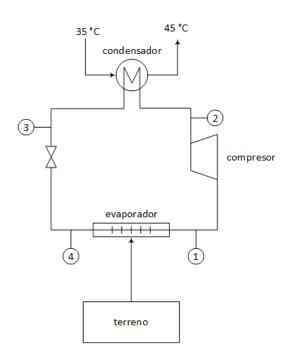

Tabla de saturación (líquido-vapor) del R290

### **TERMODINÁMICA**

# Ejercicio del Tema 5

No está permitido el empleo de calculadoras programables ni la consulta de libros, apuntes o formularios. Los teléfonos móviles y relojes "smartwatch" deberán permanecer apagados y fuera del alcance del alumno.

La figura muestra un ciclo Brayton de potencia para producir energía eléctrica a partir de energía geotérmica. El ciclo está recorrido por  $CO_2$  (sustancia pura, ver tablas) y toma calor de una corriente de 100 kg/s de fluido geotérmico (c = 4,18 kJ/kg-K;  $\rho$  = 1000 kg/m³) que llega al intercambiador GEO a 200 °C y lo abandona a 50 °C sin perder presión. El ciclo cede calor al ambiente en el intercambiador PC. El ambiente se considera un foco a 15 °C.

El compresor y la turbina son adiabáticos, con rendimientos isentrópicos de 80% y 85%, respectivamente. Las condiciones de entrada del  $CO_2$  al compresor son 85 bar y 25 °C y a la turbina 190 °C y 300 bar. Se desprecian las pérdidas de presión en los intercambiadores y conductos. El alternador tiene rendimiento 100%.

#### Se pide:

- Potencia eléctrica producida por el alternador
  Exergía destruida total
  Eficiencia exergética del intercambiador GEO

#### TERMODINÁMICA

# Ejercicio del Tema 5

Nombre	Grupos C - D
--------	--------------

No está permitido el empleo de calculadoras programables ni la consulta de libros, apuntes o formularios. Los teléfonos móviles y relojes "smartwatch" deberán permanecer apagados y fuera del alcance del alumno.

La figura muestra una bomba de calor aerotérmica que toma calor del ambiente (foco térmico a 5 °C) a través del evaporador y lo cede en el condensador a una corriente de agua que circula por un suelo radiante. El agua (c = 4,18 kJ/kg-K;  $\rho$  = 1000 kg/m³) llega al condensador a 35 °C y sale del mismo a 45 °C, sin perder presión. El condensador cede 15 kW al agua.

El compresor de la bomba es adiabático, con un rendimiento isentrópico del 75%. Las presiones a su entrada y salida son 8 bar y 30 bar, respectivamente. El fluido de trabajo (R32, ver tablas) llega al compresor (1) como vapor saturado y sale del condensador (3) como líquido saturado. Se desprecian las caídas de presión en intercambiadores y conductos.

#### Se pide:

- Potencia consumida por el compresor
   Exergía destruida total
   Eficiencia exergética del condensador
   (3 p)
   (3 p)
- Diagrama de Sankey cualitativo de la planta incluyendo todos los componentes
   (2 p)

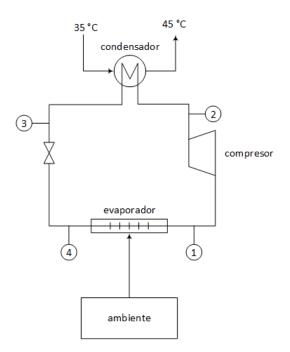

Tabla de saturación (líquido-vapor) del R32
